

To conclude, there are many factors which contribute to extreme flooding in Bangladesh, but not so many that in England. The main differences are the climate differences and the economic. In my opinion, the main differences are economic, because flood warnings, defenses and densely constructed houses all cost more money, but are effective. The UK has the money to invest in these, but ~~not~~ Bangladesh doesn't.

This is well-answered, you just need to be a bit more precise when talking about the differences in climate. Overall though, this is an excellent summary of why the effects of flooding vary - well done!

Summary: How brain biases prevent climate change action

The main reasons for lack of climate action include the way our brains have evolved. Evolution makes humans more compelled to address immediate issues, not distant, complex problems such as climate change. Also, we are programmed to prioritize ^{the} present over the past, and not to change, or finding it ~~much~~ very difficult to change once we have started doing something.
